Risks, harms & moral implications

AFSHARI-MEHR, AVESTA M. (Student)
AI being weaponised to kill on the Ukraine-Russia War frontline

MEWSE, REBECCA K. (Student)
AI Decision making in recruitment, individuals can be negatively affected

WAGSTAFF, BEN P. (Student)
AI graders

WAGSTAFF, BEN P. (Student)
COLLAPSE OF INDIVIDUALITY
Work output becoming more similar (AI output based)

SIMM, MICHAEL J. (Student)
AI-generated images/videos might get too close to reality so videos may become inadmissible in court

APPLEYARD, LOUIS G. (Student)
Art - AI art is theft

APPLEYARD, LOUIS G. (Student)
The working class is at risk of being replaced. Who will inherit the earth.

WATKINS, ERIN K. (Student)
Environmentally damaging the world
- Water usage, the world is in fresh water deficit
- people living near ai data centres have no water

AFSHARI-MEHR, AVESTA M. (Student)
AI brainrot

AFSHARI-MEHR, AVESTA M. (Student)
Half of physics lecturers use AI to mark assessments and it always seems horribly wrong

APPLEYARD, LOUIS G. (Student)
Using AI to decide likelihood of recidivism

APPLEYARD, LOUIS G. (Student)
Corporations only care for profit, not human development, are we to all work in factories when jobs are gone?

APPLEYARD, LOUIS G. (Student)
I like the ant colony thing though...

ANTHONY, ERINNA C. (Student)
AI usage in research - loss of critical thinking skills

FLEMING, AMBER Z.B. (Student)
ChatGPT giving positive affirmations to people, even when they've done something morally wrong (e.g. 'Yes, it's understandable you've cheated on your partner')

APPLEYARD, LOUIS G. (Student)
AI Chatbots / AI Dating sites being used to replace human interaction

SMITH, JAMIE SMITH (Student)
environmental impact of AI

JOHNSON, ANDREA N. (Student)
Inherent bias from programmers being present in models

SHORT, ISAAC T. (Student)
Potential misinformation, e.g. Reform making fake videos/photos of immigrants

SHORT, ISAAC T. (Student)
Biases in responses. Reinforces bias learnt from input and learning material. Big companies often owned by "the West" therefore has a western bias

DUNAS, ADAM P. (Student)
Gender-based or other kinds of human bias that is replicated by the AI - especially in medical treatment where these biases can affect lives

ALLSWELL, LILY C. (Student)
Datasets may have explicit or implicit bias, for example in a healthcare setting. AI trained on these datasets may have racial or gender bias

SHORT, ISAAC T. (Student)
Used by students instead of using their own brains, impacting learning

SHORT, ISAAC T. (Student)
Use in academic settings. Being used to help write academic papers

WATKINS, ERIN K. (Student)
AI causes people to become lazy and dependant on it.

APPLEYARD, LOUIS G. (Student)
We cannot afford to humanise the clankers

OZDEN, EMRE H.E. (Student)
AI recommendation algorithms being used to create echo chambers proliferating hate in the name of engagement. Namely the genocide of the Rohingya minority in Myanmar being enabled by Meta's recommendation algorithm creating wide-spread bigotry and hate. Source: amnesty international

WATKINS, ERIN K. (Student)
Deepfakes are made with ai is sexual harassment and is hard to manage by law

SHORT, ISAAC T. (Student)
Twitter (X) with Grok editing images without consent

SHORT, ISAAC T. (Student)
AI being used to replace people in jobs

SMITH, JAMIE SMITH (Student)
AI hallucination spreading misinformation

FLEMING, AMBER Z.B. (Student)
Even Sam Altman has stated that AI may lead to the 'end of the world'

Risks, harms & moral implications

- Environmental impacts
- Value alignment issues
- Harmful content, inaccuracies
- Privacy issues, data breaches
- Exploitation of workers
- Copyright infringement
- Labour force / sector transformation
- Unequal access to AI as costs evolve
- Impacts on social and individual wellbeing

Lecture overview

- What are biases in human thought?
- What are the implications of human biases?
- What is bias in AI?
- Examples of algorithmic bias and their consequences

What is bias?

Algorithmic bias?

Input to the PULSE face depixeliser.

Algorithmic bias?

Input to the PULSE face depixeliser.

What is bias?

Output of the PULSE face depixeliser. The underlying image is of Barrack Obama, but the output from the model, informed by biased training data, outputs a caucasian face.

In statistics /
machine
learning...

In machine learning, bias refers to any basis for choosing one generalization over another, other than strict consistency with the instances (Mitchell, 1980).

The more the bias of a certain learning algorithm fits the characteristics of a particular problem, the better it will perform on that problem (Mooney, 1996)

What is Bias – in humans?

- Simplify information processing through a filter of prior experience, preference.
- Help to make sense of the world and provide shortcuts for decision making.
- Not inherently bad, but can have negative consequences. Especially cognitive biases.
- Can contribute to perpetuating systemic inequalities.

Biases in human thought and judgement

- **Social biases:** where we automatically form impressions of people, or leap to conclusions, based on the social group that they are a member of.
 - E.g. instantly warm to someone who speaks with the same accent as us, or if we assume someone from a different ethnic group is unlikely to be telling the truth.
- **Cognitive biases:** systematic tendencies in our thought processes that can lead us into error.
 - E.g. confirmation bias, whereby we seek information which can confirm our beliefs, inadequately testing beliefs by seeking out potentially contradictory information.

Impacts on decision making and judgement

Exposure effect:

“A reliable way to make people believe in falsehoods is frequent repetition, because familiarity is not easily distinguished from truth. Authoritarian institutions and marketers have always known this fact.”

Daniel Kahneman,
Thinking, Fast and Slow

Implicit biases

- Implicit biases: automatic associations which operate without reflective control - can lead to unintentionally differential or unfair treatment of stigmatised individuals.
- Implicit Association Test

[You can take a test to explore your own implicit biases:](https://implicit.harvard.edu/implicit/selectatest.html)

<https://implicit.harvard.edu/implicit/selectatest.html>

Biases affect human decision-making

Bias & discrimination

From discriminate – ability to discern a difference

Discriminate (Cambridge Dictionary):

to treat a person or particular group of people differently, especially in a worse way from the way in which you treat other people, because of their race, gender, sexuality, etc.

- Related concepts:
 - Discrimination
 - Bias
 - (Un)fairness

Attributes Associated with Social Bias

Certain individual attributes are tied to social bias (often referred to as 'protected attributes' or 'characteristics').

Laws that prohibit discrimination based on these attributes.

E.g. Equality Act 2010 establishes and defines 9 protected characteristics:

- Age
- Race
- Sex
- Sexual orientation
- Disability
- Marriage and civil partnership
- Gender reassignment
- Religion or belief
- Maternity and pregnancy

Should we use AI to make legal judgements, e.g. sentencing and parole decisions?

Case study: criminal justice algorithms

- The COMPAS algorithm (Correctional Offender Management Profiling for Alternative Sanctions)
- A computer algorithm used by judges across the US to help make decisions about bail, sentencing, and parole
- Draws on a range of data about defendants
- Produces a "risk score" from 1-10 predicting how likely someone is to reoffend
- Used to decide whether defendants should be detained or released on bail pending trial

Discuss in groups (10 minutes)

Imagine you're designing this algorithm. You want to predict who *might* commit another crime.

What information would you want to know about someone to make that prediction?

Feedback on discussions

Imagine you're designing this algorithm. You want to predict who *might* commit another crime.

What information would you want to know about someone to make that prediction?

What Data Does COMPAS Use?

Criminal History

- Number and types of prior arrests and convictions
- Age at first arrest
- Violence in criminal history

Demographic : Personal & Social Factors

- Current age
- Employment status and history
- Educational background
- Marital status and family situation
- Substance abuse history

Social Environment

- Number of friends/associates who have been arrested
- Social isolation measures
- Community ties and support systems

Attitudes & Personality

- Responses to questions about anger management
- Attitudes toward crime and punishment
- Self-reported impulsiveness
- Cooperation with supervision

COMPAS produces scores for:

- General recidivism risk (1-10 scale)
- Violent recidivism risk (1-10 scale)
- Failure to appear risk (1-10 scale)

Algorithmic Bias

Shoplifted \$86.35 worth of tools from Home Depot.

8 prior arrests.

Convicted of armed robbery and attempted armed robbery, for which he served five years in prison, in addition to another armed robbery charge.

Two Petty Theft Arrests

	
VERNON PRATER	BRISHA BORDEN
LOW RISK 3	HIGH RISK 8

Took a child's bike and scooter. Value \$80. Dropped them and ran.

4 Misdemeanors while a juvenile.

Got it backward!

TECH POLICY

AI is sending people to jail—and getting it wrong

Using historical data to train risk assessment tools could mean that machines are copying the mistakes of the past.

By Karen Hao

January 21, 2019

- African-Americans were more likely to be assigned a higher-risk score, resulting in longer periods of detention, compared to whites who were equally likely to re-offend.

Angwin, Julia, Jeff Larson, Surya Mattu, and Laura Kirchner. "Machine Bias." ProPublica, May 23, 2016. <https://www.propublica.org/article/machine-bias-risk-assessments-in-criminal-sentencing>

Bias in predicting risk of reoffending

— Average Behavior (Global) African-American Male (Local)
- - - Caucasian Male (Local)

- Northpointe, the firm that sells the algorithm's outputs, argues that wrong metrics are being used to assess fairness in the product.
- **But how should fairness be defined and measured?**

Why would courts use it?

- Judges make these high-stakes decisions quickly with limited information
- Claims to be more "objective" than human judgment alone
- Supposed to reduce inconsistencies between different judges
- Can help identify low-risk offenders who might not need jail time

Question?

- If humans are flawed decision-makers does it matter if the algorithms are flawed too? If so, why?
- Is it better to use an algorithm if it is shown to systematically discriminate, but discriminates less than the human counterparts?
- What should be used to judge whether a system is adequate for use?

Stakeholder Perspectives

Stakeholder roles:

- Defendant
- Judge
- Victim's family
- General member of public
- Data scientist who built the system

In your groups discuss, from your stakeholder's perspective, what would be your biggest concern about this AI system?

Some considerations

- People are more likely to assume algorithms are objective and error-free
 - Cathy O'Neil: The privileged are processed by people, the poor are processed by algorithms
- More likely to implement no appeal process
- Algorithmic systems are cheaper + more scaleable
- Machine Learning can amplify bias
- Machine Learning can create feedback loops
 - Feedback loops occur when your model is controlling the next round of data you get
 - E.g. predictive policing, youtube recommendation system

Technology is power, and with that, comes responsibility!

Cathy O'Neil, Weapons of Math Destruction (2016)

Mathematical models can "encod[e] human prejudice, misunderstanding, and bias into the software systems that increasingly manag[e] our lives. [...] Their verdicts, even when wrong and harmful, [are] beyond dispute or appeal. And they tend to punish the poor and the oppressed in our society, while making the rich richer"

(O'Neil, 2016, p. 3).

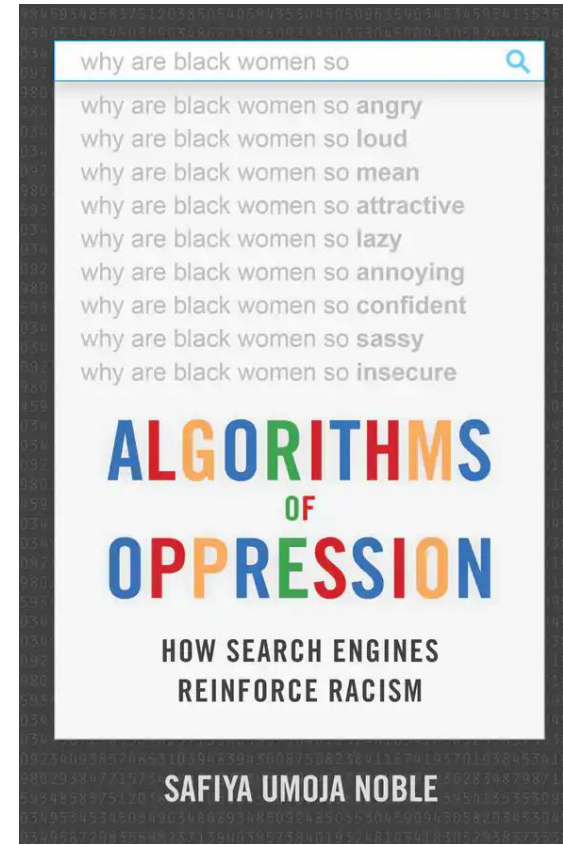

Friedman &
Nissenbaum
(1996).

“Because biased computer systems are instruments of injustice—though admittedly, their degree of seriousness can vary considerably—we believe that **freedom from bias** should be counted among the select **set of criteria** according to which the **quality of systems** in use in society **should be judged**”.

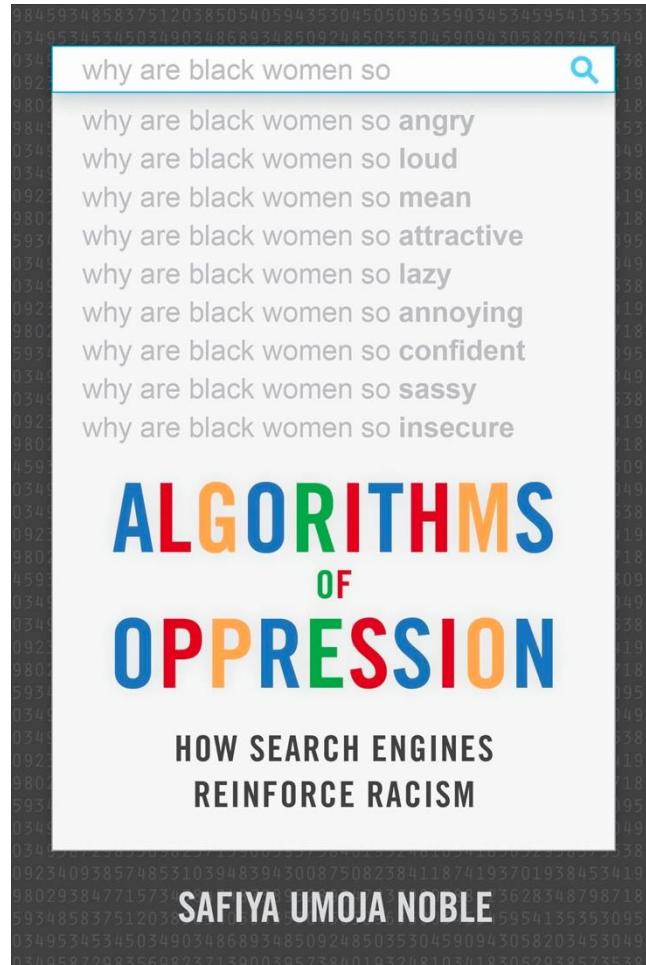

What criteria?

What should be included in the “set of criteria according to which the quality of systems in use in society should be judged”

Bias: from data to algorithms and beyond

Bias in search and recommendation

- Safiya Noble (2018)
- An analysis of textual and media searches and paid online advertising
- Search results returned for “black girls” vs “white girls” were notably different
- Sexually explicit content far more common in the former
- “algorithmic oppression is not just a glitch in the system but, rather, is fundamental to the operating system of the web”

Bias in healthcare

<https://www.theguardian.com/society/2021/nov/09/ai-skin-cancer-diagnoses-risk-being-less-accurate-for-dark-skin-study>

Amazon Reportedly Killed an AI Recruitment System Because It Couldn't Stop the Tool from Discriminating Against Women

By [DAVID MEYER](#) October 10, 2018

Machine learning, one of the core techniques in the field of artificial intelligence, involves teaching automated systems to devise new ways of doing things, by feeding them reams of data about the subject at hand. One of the big fears here is that [biases in that data](#) will simply be reinforced in the AI systems—and [Amazon](#) seems to have just provided an excellent example of that phenomenon.

Dutch scandal serves as a warning for Europe over risks of using algorithms

The Dutch tax authority ruined thousands of lives after using an algorithm to spot suspected benefits fraud – and critics say there is little stopping it from happening again.

Definitions...

Defining bias in computational & algorithmic systems

Certain aspects of a dataset are more heavily weighted and/or represented than others. This can cause low accuracy and skewed outcomes.

Different performance for diverse groups of people.

Computational systems that systematically and unfairly discriminate against certain individuals or groups of individuals in favor of others

Defining bias in computational & algorithmic systems

Certain aspects of a dataset are more heavily weighted and/or represented than others. This can cause low accuracy and skewed outcomes.

Different performance for diverse groups of people.

Computational systems that systematically and unfairly discriminate against certain individuals or groups of individuals in favor of others

What are the key differences between these definitions?

Defining bias in computational & algorithmic systems

Certain aspects of a dataset are more heavily weighted and/or represented than others. This can cause low accuracy and skewed outcomes.

Different performance for diverse groups of people.

Computational systems that systematically and unfairly discriminate against certain individuals or groups of individuals in favor of others

A key focus of this course...

“computer systems that systematically and unfairly discriminate against certain individuals or groups of individuals in favor of others.”

Bias in Computer Systems - Friedman & Nissenbaum, 1996

Pre-existing bias

Pre-existing bias has its roots in social institutions, practices, and attitudes.

When computer systems embody biases that exist independently, and usually prior to the creation of the system, then the system exemplifies pre-existing bias.

Pre-existing bias can enter a system either through the explicit and conscious efforts of individuals or institutions, or implicitly and unconsciously, even in spite of the best of intentions.

What are some sources or examples of pre-existing bias?

Pre-existing bias

Individual

“Bias that originates from individuals who have significant input into the design of the system, such as the client commissioning the design or the system designer (e.g., a client embeds personal racial biases into the specifications for loan approval software)”.

Societal

“Bias that originates from society at large, such as from organizations (e.g., industry), institutions (e.g., legal systems), or culture at large (e.g., gender biases present in the larger society that lead to the development of educational software that overall appeals more to boys than girls)”.

Technical Bias

Technical bias arises from technical constraints or technical considerations. For example:

Decontextualized Algorithms

Bias that originates from the use of an algorithm that fails to treat all groups fairly under all significant conditions

Formalization of Human Constructs

Bias that originates from attempts to make human constructs such as discourse, judgments, or intuitions amenable to computers: when we quantify the qualitative, discretize the continuous, or formalize the nonformal

Q. What is a human construct or concept used in ML tasks that might be difficult to formalise?

Emergent Bias

Emergent bias arises in a context of use with real users. Typically emerges some time after a design is completed, as a result of changing societal knowledge, population, or cultural values.

- New Societal Knowledge
- Mismatch between Users and System Design
- Different Expertise
- Different Values

Bias is
multifaceted!

- There are many different taxonomies of bias
- Not expected to know all types
- Do need to understand how bias enters at different points in the pipeline, from societal factors through to data collection, preparation, model development and deployment!
- Here we will explore some specific subtypes to start to navigate this...

Check blackboard for associated reading & tasks

Friedman, B., & Nissenbaum, H. (1996). Bias in computer systems. ACM Transactions on information systems (TOIS), 14(3), 330-347.

- In the paper the explore a number of examples, in each try to identify:
- What went wrong?
- Who was harmed?
- Who benefitted?
- What (if anything) is offered as a way to mitigate such harm in the future?
- Are there any limitations to the approach?
- From 1996 – is the approach appropriate for modern-day systems that incorporate machine learning?
- [The Trouble with Bias by Kate Crawford \(NeurIPS 2017\)](#)
